Transportation Engineer’s Association of Missouri 2018 Conference

March 8, 2018

James M. Schmidt, P.E., P.Eng., D.GE.
Principal Geotechnical Engineer
MSE Wall Engineering
A New Look at Contracting, Design, and Construction
Why Do We Need Change?

- Whitman (1984) states that appropriate structural designs should have a failure rate in the range of 1 in 1,000 to 1 in 10,000.

- Soong and Koerner (1999) reported MSE wall failures at a rate of approximately 1 in 1,000 (26 failures reported for approximately 35,000 walls).
Why Do We Need Change?

Why Do We Need Change?
Why Do We Need Change?
Why Do We Need Change?
Where Do You Want to Put Your Risk?

- Cost to construct
  - MSE Wall typical cost - $30 to $65 per sf

- Cost of failure
  - MSE Wall stabilization - $60 to $130 per sf
  - MSE Wall replacement - $300 to $650 per sf
What Change is Needed?

- Better communication between designers
- Better identification of conflicts
- Better documentation during construction
- Accountability by all parties

Traditional Geotechnical Report Information

6.2 RETAINING WALL DESIGN CRITERIA

The bearing resistance values and maximum allowable wall heights presented in the following report sections are based on the criteria listed below.

1. The walls will be embedded at least 2 feet below final grade next to the wall.
2. The walls will have a two-foot-wide mow strip at the toe of the walls. The ground surface beyond the mow strip will slope down at a maximum slope of 4 horizontal to 1 vertical (4H:1V) for a horizontal distance of 20 feet or less and will then be flat and level.
3. The MSE and CIP walls will be well drained.
4. The MSE walls will have a minimum anchor length of 8 feet and all the wall anchors will have the same length within a vertical section of wall. In addition, the minimum MSE wall anchor length will not be less than 70 percent of the wall height.
5. The walls will have a safety factor of at least 2.0 for bearing resistance.
6. The wall foundation subgrades will be prepared in accordance with the recommendations presented in this report.
7. Design soil strengths for computing the bearing resistance values were selected based on triaxial test results and TCP test results.
8. The maximum allowable wall heights that would not apply a bearing pressure that would exceed the allowable soil bearing resistance were computed based on a lateral earth pressure of 40 pcf, backfill soil unit weight of 125 pcf, and a distributed surcharge load of 240 psf.
9. The wall height is the vertical distance from the base of the wall at the top of the leveling pad to the top of the retained fill.
6.5 SLIDING RESISTANCE

An ultimate coefficient of sliding resistance of 0.40 is recommended for design of the MSE and CIP walls. The retaining walls should have a safety factor of at least 1.5 with respect to sliding.

DISCLAIMER: The use of this standard is governed by the “State Engineering Practice Act”. No Warranty of any kind is made by the DOT for any purpose whatsoever. The DOT assumes no responsibility for the conversion of this standard to other formats or for incorrect results or damages resulting from its use.

**DESIGN PARAMETERS:**
Design of retaining walls shall be based on the following design parameters:

- Random Backfill
  - Unit weight = 125 pcf
  - φ = 30°, c = 0 psf

- Select Backfill
  - Unit weight = 125 pcf
  - φ = 34°, c = 0 psf

- Cement Stabilized
  - Unit weight = 125 pcf
  - φ = 45°, c = 0 psf
Traditional MSE Wall Design

- **Construction Contract Design and Coordination**
  - G/C designs MSE Wall (Shop Drawings)
  - CM reviews shop drawings
  - CM coordinates with Contractor to resolve field issues

RWC Design Duties

- Project Plans
  - Clearly identify anticipated materials
  - Standard Sheets modified to include site specific parameters
RWC Design Duties

- Review Plans and Specifications
  - Verify the geotechnical parameters
  - Verify that the geotechnical engineer has performed slope stability analyses for the final design
  - Identify conflicts that impact wall design and performance
  - Verify conflicts have been resolved
### RWC Verifies Design Checklist

- Wall Elevations
- Leveling Pad
- Facing Units
- Utilities
- Drainage
- Wall Details
- Soil Reinforcement
- External Stability
- Internal Stability

RWC Preconstruction Duties

- Communicate critical wall system elements
- Provide project specific training to personnel involved with wall construction
- Communicate expectations
Field Inspection Checklist

Table 11-1. Outline of MSE/RSS Field Inspection Checklist Requirements.

1. Read the specifications and become familiar with:
   - material requirements
   - construction procedures
   - soil compaction procedures
   - alignment tolerances
   - acceptance/rejection criteria

2. Review the construction plans and become familiar with:
   - construction sequence
   - corrosion protection requirements
   - special placement to reduce damage
   - soil compaction restrictions
   - details for drainage requirements
   - details for utility construction
   - formation of slope face
   - contractor's documents

3. Review material requirements and approval submittals.
   Review construction sequence for the reinforcement system.

4. Check site conditions and foundation requirements. Observe:
   - preparation of foundations
   - leveling pad construction (check level and alignment)
   - site accessibility
   - limit of excavation
   - construction ditching
   - drainage features, seeps, adjacent streams, lakes, etc.

5. On site, check reinforcements and prefabricated units. Perform inspection of prefabricated elements (e.g., casting yard) as required. Reject precast facing elements if:
   - compressive strength < specification requirements
   - molding defects (e.g., bent models)
   - honeycombing
   - severe cracking, shipping or spalling
   - color or finish variation
   - tolerance control
   - misaligned connections

6. Check reinforcement labels to verify whether they match certification documents.

7. Observe materials in batch of reinforcements to make sure they are the same. Observe reinforcements for flaws and nonuniformity.

8. Obtain test samples according to specification requirements from randomly selected reinforcements.

9. Observe construction to see that the contractor complies with specification requirements for installation.

10. If possible, check reinforcements after aggregate or riprap placement for possible damage. This can be done either by constructing a trial installation, or by removing a small section of aggregate or riprap and observing the reinforcement after placement and compaction of the aggregate, at the beginning of the project. If damage has occurred, contact the design engineer.

11. Check all reinforcement and prefabricated facing units against the initial approved shipment and collect additional test samples.

12. Monitor facing alignment:
   - adjacent facing panel joints
   - precast face panels
   - modular block walls
   - wrapped face walls
   - line and grade
RWC Construction Duties

- Verifies that the specified materials are being provided
- Verifies that the field testing is being performed in accordance with and meets the project specifications
- Verifies that the various disciplines have reviewed the as-built drawings and daily reports as necessary
RWC Construction Duties

- Provides support regarding field changes
- Assures appropriate parties are involved in field change process
- Provide project specific training of field QA/QC personnel with respect to walls
RWC Construction Duties

- **Project Documentation**
  - Review QA/QC documentation for compliance
  - Maintain weekly wall progress reports
  - Prepare final wall acceptance reports
Challenges

- Coordination with multiple entities
Challenges (continued)

- Design interpretations
Challenges (continued)

- Controlling surface water runoff
Challenges (continued)

- Backfilling against the wall facing
Challenges (continued)

- Strapping installation
Final Acceptance Report

- Compile all project specific data for each wall
  - As-built drawings
  - Field inspection reports
  - QA/QC field and laboratory data
  - Manufacturers submittals
  - A statement that the wall was built in conformance with plans and specifications
RWC Results
RWC Results
RWC Results
Where Do You Want to Put Your Risk?

- MSE Wall Typical Cost - $30 to $65 per SF
- Cost of failure
  - MSE Wall Stabilization - $60 to $130 per sf
  - MSE Wall Replacement - $300 to $650 per sf
- Cost of Retaining Wall Engineer
  - MSE Wall Construction Cost with RWC - $5.00 to $10.00 sf
Questions
